LAB TASK

Lab Task — Employee Work Summary

Problem Statement:

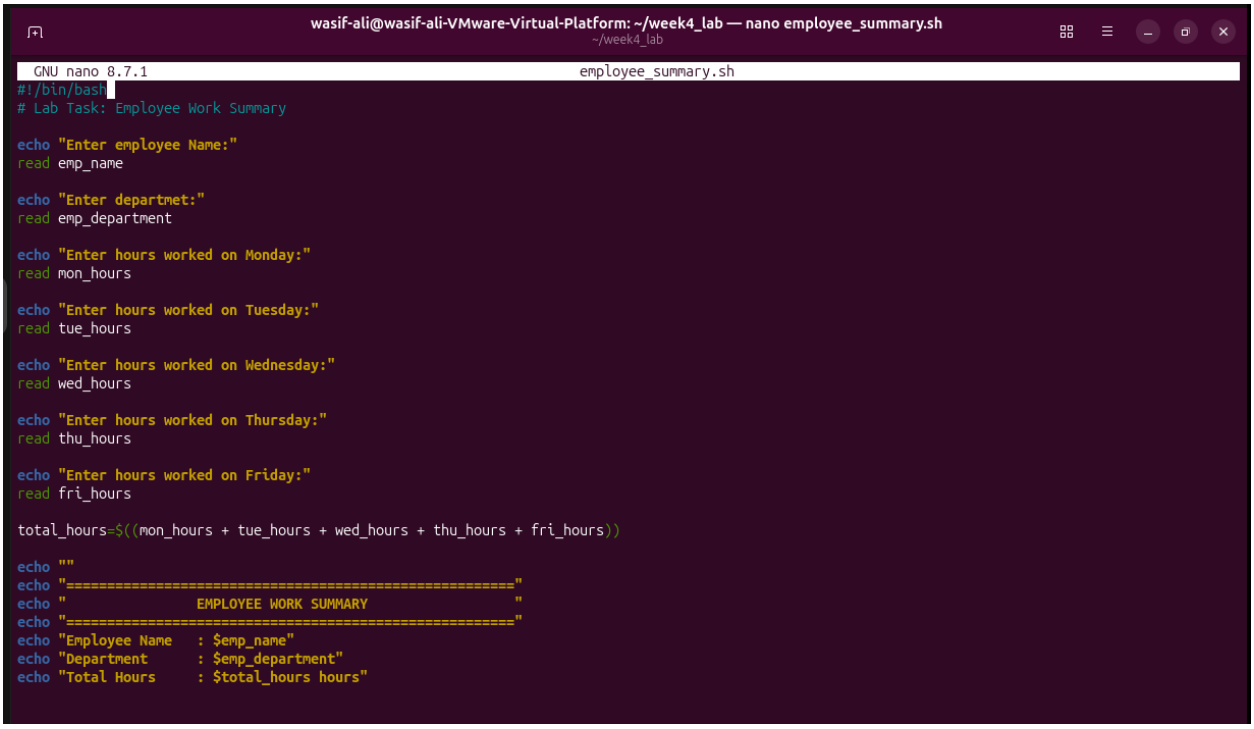

Prepare a Bash script named employee_summary.sh that asks the user to enter an employee's name, department, and number of hours worked during the week. Calculate the total working hours and display the employee's information along with a properly formatted work summary. The script should be created, executed, and tested in the Ubuntu terminal.

Task Description

- **Objective:** To write, execute, and test a Bash script in an Ubuntu terminal environment that handles interactive user input, performs multi-variable arithmetic expansion, and outputs a formatted summary card.
- **Implementation:**
  - Define /bin/bash as the script interpreter on the first line using the shebang construct (#!/bin/bash).
  - Use the read command to capture standard input from the user for text strings (name, department) and integers (hours worked).
  - Store inputs into variables following Bash syntax standards (no spaces surrounding the assignment = operator).
  - Apply Bash integer arithmetic expansion $((...)) to aggregate the total weekly hours.
  - Present a structured summary block to standard output using echo statements.

employee_summary.sh

Script File (Shell Script Code)**:**

Commands:
